FM-1 emulator - Update History

Transistor Labs - ticcoross@gmail.com

Version 1.5.4

- The About button and Size menu are now at the left of the top bar, so they stay visible at every window size (at 75% they were cut off).

Version 1.5.3

- Window size: choose it in the Size menu and reopen the window; it opens at the new size in every host. The corner drag is removed (hosts did not follow it reliably).

Version 1.5.2

- Turning SELECT, PRESETS, ALGORITHM or KNOB 1-4 on the panel now moves its host parameter, so the host can reveal, record and MIDI-map it (Ableton's Configure mode).
- The Mac plugin is universal (Apple silicon and Intel).
- Smoother resizing: an outline shows the new size while you drag the corner, and the window changes once, when you let go.
- Size menu: 75%, 90%, 100%, 110%, 125%; the largest size is now 125% so the window fits a laptop screen.

Version 1.5.1

- Size menu in the top bar: 75%, 100%, 125%, 150%.
- MIDI-mapped knobs: a full sweep is now 128 clicks (one per MIDI value), so settings like the filter cutoff reach their full range.
- Dragging the corner keeps the window's proportions and stops at a maximum size, so the corner can no longer end up off screen.
- No more dark gap above the panel when resizing: the window takes the panel's exact shape and the panel sits under the top bar.
- Manual: resizing updated.

Version 1.5.0

- Knobs and buttons are host parameters: MIDI mappable and automatable.
- Bigger KNOB 1-4 and buttons on the right side of the panel.
- Fixed: resizing the window on Retina screens left the panel small in a corner.
- Manual: new chapter on MIDI mapping.

Version 1.4.0

- New panel layout with a much larger screen, about twice the size.
- Resizable window: drag the bottom-right corner; the panel keeps its proportions.
- The window size is saved with the DAW project and restored when it is opened again.
- The screen scales with the window: smoothed when shown small, sharp pixels when shown larger than 240 x 240.
- Manual: resizing explained in The Plugin Window.

Version 1.3.0

- The whole unit is visible: rounded case corners, case side and shadow.
- Logo and model name with a silk-screen printed look.
- MIDI clock runs whenever the DAW has a tempo, so firmwares stay locked to it (SLOOP: GLO > SYSTEM > SYNC = TRS).
- Panel keys light up for incoming MIDI notes.
- Manual: new chapter on syncing to the DAW tempo, with the SLOOP procedure.

Version 1.2.0

- Sync to host: the DAW's tempo is sent to the firmware as MIDI clock, with Start and Stop following the transport.
- Notes and clock reach the firmware in exact time order.
- Manual: MIDI channel and tempo sync tips.

Version 1.1.0

- New Transistor Labs panel design: warm beige body, brown knurled knobs, cream and brown keys.
- Keys and buttons light up orange when the firmware turns on their LEDs, and show a pressed state.
- Correct 27-key FM-1 keyboard layout (F3 to G5).
- Larger default window.

Version 1.0.0

- First release of FM-1 emulator by Transistor Labs.
- AU, VST3 and CLAP for macOS (Apple silicon, macOS 12 or later); VST3 and CLAP for Windows x64 and Linux x64.
- Installers: .pkg (macOS), setup .exe (Windows), install script (Linux).
- Load any FM-1 firmware package (.fwsc) or shared setup (.fm1save); export setups.
- Playable front panel with screen, keys and knobs; SMK-37 panel for SMK-37 packages.
- Custom Transistor Labs About window.
- Based on fm1-emu 0.4.0 by Joakim Eriksson (MIT).
